

XYZ BANK LIMITED

Test Summary & Bug Report — Stakeholder Briefing

Container Logistic System (CLS) · Sign-Up & Onboarding Module · Test Cycle 1 · 03 July 2026 ·

Executive Summary

This report presents the results of the testing conducted on the Container Logistics application, covering key user journeys including user registration and onboarding for multiple user types such as Shippers, Insurance Companies, and Terminal Operators.

A total of **9 defects** were identified during testing. These consist of **1 Critical defect**, **7 Major defects**, and **1 Minor defect**, with all defects currently in a **Failed/Open** state. The issues span input validation, mandatory field enforcement, API functionality, user experience, data integrity, and regulatory compliance.

The most significant finding is a **Critical API failure** that prevents Insurance Companies from completing the onboarding process, making the affected functionality unusable and directly impacting business operations. In addition, several Major defects allow users to bypass mandatory onboarding sections, accept invalid business and regulatory information, or proceed without mandatory consent, introducing substantial risks to data quality, operational accuracy, and compliance with privacy and regulatory requirements.

While some defects primarily affect usability—such as unclear validation messages—others have broader business implications, including delayed customer onboarding, increased support effort, inaccurate operational records, potential regulatory exposure, and loss of stakeholder confidence.

Based on the severity and business impact of the identified defects, the current build presents a **High release risk**. It is recommended that the Critical defect and all compliance- and data-integrity-related Major defects be resolved and successfully retested before the application is approved for production deployment. A regression test should then be performed to verify that fixes have not introduced additional issues and that all critical business workflows operate as expected.

Testing at a Glance

Open

Metric	Result	Metric	Result
Test cases executed	36	Total defects logged	9
Passed	27	Critical	1
Failed	9	High	7

Top Defects Requiring Immediate Attention

The following Critical and High defects are the showstoppers for this release. Each carries a direct business or security impact.

Defect Status Overview

Defect ID	Defect Summary	Business Impact
DEF-001	Phone accepts alphabetic characters	Poor data quality enters the system, making it difficult to contact users. Invalid phone numbers can lead to failed notifications, customer support issues, and reduced trust in the platform.
DEF-002	Invalid License/NAICOM accepted	Unverified or fraudulent insurance companies could be onboarded. This creates regulatory and compliance risks, damages credibility, and may expose the business to legal penalties.
DEF-003	Cannot PUT /api/insurance/claims	Critical business blocker. Insurance companies cannot complete onboarding, preventing new partners from joining the platform. This directly impacts revenue generation, customer acquisition, and operational rollout.
DEF-004	Optional cargo insurance treated as mandatory	Legitimate users may abandon onboarding because they are blocked by a field that should be optional. This increases onboarding drop-off rates and creates unnecessary support requests.
DEF-005	Mandatory sections bypassed	Users can submit incomplete operations profiles, resulting in inaccurate operational data. This may cause failed logistics operations, downstream processing errors, and increased manual data correction.
DEF-006	Data Sharing & Consent skipped	High compliance risk. Users can proceed without providing mandatory consent, potentially violating

Defect ID	Defect Summary	Business Impact
		privacy and data protection regulations. This exposes the business to legal, regulatory, and reputational consequences.
DEF-007	Mandatory sections bypassed (Terminal Identity)	Incomplete terminal information can be stored, affecting terminal identification, operational planning, reporting, and integrations with other systems. Manual intervention may be required to correct records.
DEF-008	Incorrect validation message	Users receive misleading feedback and may not know all fields that require correction. This increases user frustration, slows onboarding, and generates avoidable customer support inquiries.
DEF-009	Consent skipped	Critical compliance issue. Operations users can access the platform without agreeing to mandatory consent terms. This increases legal exposure, audit failures, and risks related to unauthorized processing of user data.

Recommendations

The product is not recommended for release.

If the application is released with these defects:

- **Critical blockers:** DEF-003, DEF-005, DEF-006, DEF-007, and DEF-009 significantly impact onboarding, compliance, and data integrity. These should be resolved before production release.
- **Major usability and data quality issues:** DEF-001, DEF-002, DEF-004, and DEF-008 reduce user confidence, increase support costs, and may lead to invalid business data entering the system.
- **Business recommendation:** The release carries a **High** overall business risk. The application is **not recommended for production** until all critical defects are resolved and the major validation defects have been addressed or formally accepted with mitigation plans.

Conclusion

The Sign-Up and Onboarding module is functionally close to ready: the journeys work for every user type and most validations behave correctly. It is, however, not release-ready in its current state because of open Critical and High security and control defects. Once these are fixed and re-verified, the module can confidently move to UAT and, subsequently, release.
